Can breathing occur in germinating seeds? The investigation laboratory kit begins with a basic activity that indicates to students to measure the quantity of oxygen consumed by the germination of mung beans and control seeds. By recording and measuring any changes, students are able to calculate the breathing rate of these seedlings in specific conditions. These observations and data the basis for the laboratory survey opportunities. Questions like: "The amount of time from the beginning of germination affects the breathing rate?" Apply the scientific principles and evidence to provide an explanation about the effects of the change of temperature or concentration of the reagent particles on the rate to which a reaction occurs. HS-LS1-3. Plan and conduct an investigation to provide tests that feedback mechanisms maintain homeostasis. HS-LS1-7. Use a model to illustrate that cellular respiration is a chemical process in which the links of food molecules and oxygen molecules are broken and the links in new compounds are formed, with consequent net transfer of energy. HS-PS2-3. Apply scientific and engineering ideas to design, evaluate and refine a device that minimizes the strength on a macroscopic object during a collision.
